This species was originally described based on a single female collected in Deliblato sands (north-eastern Serbia) and deposited in the collection of Museum für Naturkunde, Berlin (MNKB). Since then, no reliable records of this small, dark-legged species from Europe were known, and no material in European collections was found during the taxonomic revision in 2012–2016. Finally, it was surprisingly found among my own material collected in Greece fourteen years ago and now deposited at the I.I.Schmalhausen Institute of Zoology, Kyiv (SIZK).

***Tephritis hungarica* Hering, 1937**

Material examined: Type. Holotype ♀: **Serbia:** Vojvodina: “S. Ungarn, 61705.V” [Sand steppe near Deliblat (now Deliblato) and Dubovac, 23–30.05 (year unknown), Holtz leg. 44.86N,21.11E] (MNKB). **Non-type. Greece:** Olympus, above Prionia (40.08N,22.38E), h=1080–2000 m, 8.06.2002, 13♂, 8♀ (S. & V. Korneyev, E. Kameneva) (SIZK).

Distribution: Serbia (Hering, 1937), Greece mainland (first record).

Figs 1–5: *Tephritis hungarica*, ♂ (1–3) ♀ (4). Figs 1, 4, habitus, left. Fig. 2, head and mesonotum, dorsally. Fig. 3, wing; Fig. 5, known distribution. Scale bar: 1 mm.

Hering, E. M. (1937) Neue Bohrfliegen aus der Beckerschen Sammlung (Dipt.) (16. Beitrag zur Kenntnis der Trypetidae). *Mitteilungen aus dem Zoologischen Museum in Berlin*, 22, 244–264.
